Frequently asked questions

Is this made by Sonos?

No. Somos InControl is an independent, unofficial third-party app. It is not affiliated with, endorsed by, or sponsored by Sonos, Inc. It uses the publicly documented local control protocol to talk to Sonos speakers on your Wi-Fi.

Which Sonos speakers does it work with?

It works with most current and recent Sonos speakers that support local control on the network — including popular soundbars, wireless speakers, and multi-room setups. If your speaker shows up in the official Sonos app on the same Wi-Fi, it should show up here too.

If a specific model isn't being discovered, let us know through the contact form with the model name and we'll investigate.

Do I need a Sonos account? +

No. Somos InControl does not use your Sonos account and will not ask you to log in. It talks to your speakers directly over Wi-Fi.

Why does it ask for Local Network permission? +

iOS requires any app that discovers and talks to devices on your local Wi-Fi to ask for Local Network permission. Somos InControl needs this to find your Sonos speakers. Without it, the app will have nothing to control. The permission only lets the app see devices on the Wi-Fi you're currently connected to.

Does it work over cellular or when I'm away from home? +

No. Somos InControl only works on the same local Wi-Fi as your Sonos speakers. That's a deliberate design choice — it's what keeps the app fast, private, and account-free. If you're away from home, use the official Sonos app for remote control.

How do I save a preset? +

Dial in the volume and EQ settings you want, then open the presets row and choose "Save as preset." Give it a name, and it's saved. Tap it any time to recall those exact settings.

Can I control more than one Sonos speaker? +

Yes. All your discovered Sonos speakers appear as tabs at the bottom of the screen. Tap a tab to switch which speaker you're controlling.

What is TruePlay and should I enable it? +

TruePlay is Sonos's room calibration feature — it tunes your speaker's sound to match the acoustics of your room. If your speaker supports it, turning it on usually improves sound. Somos InControl shows the current TruePlay state and lets you toggle it.

Does Somos InControl collect any data about me or my speakers? +

No. Nothing. Nothing leaves your device except the local control messages your speakers need. See the [Privacy Policy](#) for details.

Troubleshooting

The app can't find my speakers

1. Make sure your iPhone or iPad and your Sonos speakers are on the *same* Wi-Fi network. Many routers split 2.4 GHz and 5 GHz into separate SSIDs — your speakers might be on one and your phone on the other.
2. Check that you granted **Local Network** permission when the app first launched. You can re-enable it in **Settings** → **Somos InControl** → **Local Network**.
3. Open the official Sonos app on the same device. If it can't see your speakers either, the issue is with the network — try restarting your router and speakers.
4. Force-quit Somos InControl and reopen it. Discovery runs fresh on launch.

Volume or EQ changes aren't sticking

Somos InControl sends changes directly to the speaker over your local network. If a change doesn't seem to take, check your Wi-Fi signal strength. Brief Wi-Fi drops can cause a command to miss. Try it again once the connection is steady.

The tutorial keeps popping up

The tutorial is designed to run once, then disappear. If it's re-appearing, there may be an issue with local storage. Uninstalling and reinstalling the app will fix it.

The app crashes on launch

Force-quit the app and reopen it. If that doesn't work, restart the device. If it's still crashing, contact us through the form below with your device model and iOS version.
